Art Unit: 2819

1. Claims 1-20 are allowed.

2. The following is an examiner's statement of reasons for allowance: a method of distinguishing an analog drive signal from a pickoff signal for attenuating the effect of electrical cross-coupling between the analog drive signal and the pickoff signal. The method may include receiving a periodic digital signal at a first frequency in the form of a stream of digital data values, randomly inverting at least one of the digital data values and converting the stream of digital data values to a stream of analog data values to form an analog drive signal. . The method may also include driving a sensor, physically coupled to a resonate member configured to oscillate at a second frequency, using the analog drive signal and sensing changes in the movement of the resonant member detected by the sensor for producing a pickoff signal, has not been shown in the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Platt discloses a method for reducing effects of common mode oscillations between two respective proof masses in micro-electromechanical systems (MEMS) devices, the MEMS devices also including a motor pickoff comb, a sense plate, and a motor drive comb for each proof mass, said method comprising:

amplifying signals received from respective motor pickoff combs;
inverting the amplified signal from one of the motor pickoff combs;
generating a difference signal between the inverted, amplified signal from one pickoff comb, and the non-inverted, amplified signal from the other pickoff comb;
inputting the difference signal into a control loop; and
generating motor drive signals for respective motor drive combs with the control loop.
